

When you are working on a new feature or making changes to your code, it's important to keep your feature branch up to date with the latest changes in the main branch.

Follow these steps to keep your branch up to date:

1. Check out the main branch: `git checkout main`
2. Get latest changes: `git pull`
3. Check out your feature branch: `git checkout <feature-branch-name>`
4. Merge the main branch changes: `git merge main`
5. Push changes to the remote repository: `git push`

These steps will ensure that your feature branch is updated with the latest changes from the main branch.
